

PIC, which stands for Pig Improvement Company, came to South Dakota in 2008, but the company has been doing business with South Dakota pork producers since the early 70s.

“We chose to locate in South Dakota because of the benefits of being close to our customers, yet far enough away from other pigs to ensure the health and biosecurity of our animals, said Tabatha Jeter, head of PIC’s marketing department. “Additionally, the friendly corporate environment and excellent work ethic of potential employees made the state very appealing.”

“The operation in South Dakota is part of our global genetic development program, which is constantly working to improve the animals we provide our customers. This operation allows us to provide our customers with products they demand while making us competitive with other companies in the industry,” Jeter concluded.

About PIC: PIC is the international leader in providing genetically superior pig breeding stock. The company combines quantitative sciences with leading edge biotechnology to develop non-GMO breeding stock that is focused on meeting the needs of its customers. Operating for over 45 years, PIC’s success is attributed to its significant investment in people, genetics, technology and health.
